## RETAIL SALES OF GOODS : AUSTRALIA <br> MONTH OF AUGUST 1971 (PROVISIONAL)

Reference No. 11.6

A provisional estimate of the total value of retail sales in Australia lexcluding motor vehicles, parts, petrol, etc.) for the month of August 1971 is shown in the table overleaf. Figures for some earlier months are also shown for purposes of comparison.
2. The provisional monthly estimates of retail sales are obtained from a sub-sample of establishments used to provide quarterly estimates of the value of retail sales. The monthly sub-sample is comparatively small since it is designed to provide prompt estimates of the total value of retail sales lexcluding motar *ehicles, parts, petrol, etc.) without placing an undue burden on either the resources of the Bureau or upon retall establishments.
3. As the provisional monthly estimates are derived from returns received from a sample of retail establishments they may differ somewhat from the results which would have been obtained from a comparable complete collection. A measure of the likely difference is given by the standard error of the estimate. There are about 2 chances in 3 that a sample estimate will differ from results which would be obtained froma comparable complete collection by less than 1 standard orror and 19 chances in 20 that the difference would be less than 2 standard errors. If, for example, a sample gives an estimate of $\$ 500 \mathrm{mlili}$ ion and the standard error of this estimate is 1 per cent, i.e. $\$ 5$ million, then there are 2 chances in 3 that a comparable complete collection would give a figure within the range of $\$ 495$ million to $\$ 505$ million and 19 chances in 20 that the figure would be within the range of $\$ 490 \mathrm{milli}$ ion to $\$ 510$ million.
4. The standard error of the provisional estimates of the total value of monthly retail sales lexcluding motor vehicles, parts, petrol, etc.) is about 1.0 per cent. The standard error of the month-to-month movement of the provisional estimates of the value of retall sales is generally about 0.3 per cent of the current monthly estimate. For example, the movement in the value of retail sales between the months of July and August 1971 is shown by the original series in the table overleaf as a decrease of $\$ 16.9 \mathrm{million}$. The standard error of this movement is about 0.3 per cent of the August 1971 estimate, i,e. approximately $\$ 2.3$ million. Therefare, there are 2 chances in 3 that the movement in the value of retail sales between July and August 1971 was between $\$ 14.6$ million and $\$ 19,2$ million and 19 chances in 20 that it was between $\$ 12.3$ million and $\$ 2.5$ million. Expressed in another way, the estimates show a proportionate movement in the value of retail sales between July and August 1971 of 2.1 per cent and this has a standard error of about 0.3 percentage points, i.e., there are 2 chances in 3 that the proportionate movement was between 1.8 per cent and 2.4 per cent and 19 chances in 20 that it was between 1.5 per cent and 27 per cent.
5. The provisional monthly estimates may also differ from those which would be obtained fram a sample as large as that used to provide quarterly estimates. Hence, the sum of the provisional estimates for the three months comprising a quarter may differ from the estimate obtained for that quarter from the full quarterly sample. The standard error of this difference is approximately 0.8 per cent of the quarterly estimate. The monthiy estiaates are subsequently adjusted in accordance with the prellminary and final quarterly estimates as they become avallable.
6. Seasonally adjusted statistics are also shown in the table overleaf. In the seasonal adjustment,: mecount has been taken of both normal seasonal factors and "trading-day" effects larising from the varying numbers of Sundays, Mondays, Tuesciays, etc. in the month). While the normal seasonal factors should change only gradually from year to year, the trading-day adjustment for any month will vary from year to year in accordance with the combination of days which occur in the month. Adjustment has also been made for the effects of movement in the date of Easter and Australla Day. However, as the series has beerhcomplied only since April 1961 these adjustmsnta are based necessarily on limited data and could be subject to revision when data for further years become avallable. It should be noted that the seasonally adjusted figures reflect the sampling errors to which the original figures are subject. Detalis of the methods used in seasonally adjusting this and other series are given in "Saasonally adjusted indieators 1971" (Reference No. 1. 10) of 2 July 1971.
7. All figures in this bulfetia ape on a basis comparable with the 1961-62 Retail Census. Further informatton relating to the basis on whioh the statisties of retall sales of goods are complled is contained in the quarterly bulletin "Retail Salies of Goods" (Reference Mo. 11, 4) June quarter 1971 of 60 0itober 1971.
