MAIN FEATURES

TOTAL VALUE OF RETAIL SALES OF GOODS (EXCLUDING MOTOR VEHICLES, PARTS, PETROL, ETC.), AUSTRALIA

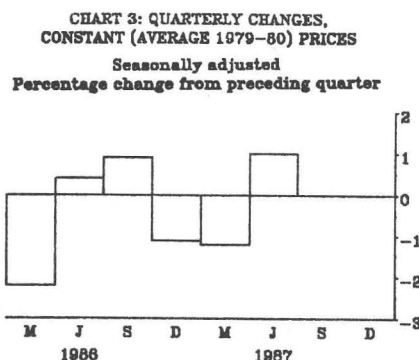

This publication includes trend estimates of retail sales, which have been derived by smoothing the series of seasonally adjusted estimates. The smoothing of seasonally adjusted series is a means of reducing the impact of the irregular component of the series to provide a basis for identifying the underlying trend. However, the trend estimates for the most recent months are subject to revision as data for subsequent months become available. Further details are given in paragraphs 16 to 23 of the Explanatory Notes at the end of this publication.

Estimates are subject to sampling and non-sampling variability as explained in paragraphs 10 to 15.

AUSTRALIAN TOTAL ESTIMATES (see Charts 1 to 3)

For August 1987, the estimated value of retail sales in Australia (excluding sales of motor vehicles, parts, petrol, etc.), in original terms, is \$4,696.2 million (see Chart 1). With the addition of data for August 1987, the trend estimates show monthly growth of 0.8% in August 1987, maintaining the steady growth rates of the past few months. The trend estimate for August 1987 is 7.8% higher than that for August 1986.

In seasonally adjusted terms, August 1987 shows a decrease of 1.4% following an increase of 3.6% in July 1987. Users should take note of the comment contained in previous releases of this bulletin that the changes to school holiday arrangements in a number of States may have affected the seasonality of the series. The seasonal adjustment process is not able to identify and correct for any changed retail sales patterns that may have resulted.

INDUSTRY ESTIMATES (see Charts 4 to 9)

With the addition of figures for August 1987, the trend estimates for most industries have maintained the picture portrayed last month with the July estimates.

For Grocers, confectioners and tobacconists, which account for about 32% of retail sales, the trend estimates show no growth for virtually the last 3 months after falling from a monthly growth of 0.9% in January 1987 (see Chart 4).

Other food stores (excluding butchers) which account for about 7% of total retail sales, continue to show growth rates in excess of 1% per month. For August the monthly growth is 1.2% after falling slightly from the growth of 1.5% recorded in June and July 1987 (see Chart 5).

For Hotels, liquor stores, licensed clubs (11% of total retail sales), the trend estimates show steady monthly growth of 0.5% since April 1987 (see Chart 6).

For Clothing and fabrics stores (9% of total retail sales) the trend estimates show monthly growth of 1.5% in August 1987 after peaking at 1.9% in May and June 1987 (see Chart 7).

Department stores (10% of total retail sales) show a growth rate of 0.8% in August 1987, while the previously estimated monthly growth rates for June and July have been revised downwards slightly (see Chart 8).

The growth rate in the trend estimates for Electrical goods stores (5% of total retail sales), is 0.9% in August 1987 after being above 1% since February 1987 (see Chart 9).

STATE ESTIMATES (see Charts 10 to 15 on page 7)

With the inclusion of figures for August 1987 the growth in trend estimates for June and July, has been revised upwards slightly in all States with the exception of Western Australia and Tasmania.

New South Wales (36% of total retail sales) trend estimates show a monthly growth rate of 0.7% in August 1987 after growing at an estimated rate of 0.9% for the previous four months (see Chart 10).

For Victoria (26% of total retail sales) trend estimates show a growth rate of 1.0% in August 1987.

For Queensland (16% of total retail sales), the monthly growth of the trend estimates has increased to 0.8% in August 1987 from a low of 0.1% in the early months of 1987 (see Chart 12).

The trend estimates for South Australia (8% of total retail sales), show a monthly growth rate of 0.9% in August 1987, while growth rates for May to July 1987 have been revised upwards to between 0.8% and 1.0% (see Chart 13).

For Western Australia (9% of total retail sales), the growth rate of the trend estimates of retail sales is 0.3% in August 1987, with the rate declining progressively from a level of 1.1% in October 1986 (see Chart 14).

For Tasmania (3% of total retail sales), the monthly growth rate is 0.2% in August 1987 after peaking at 1.4% in March and April 1987. The previous estimates for June and July have been revised downwards (see Chart 15).

EXPLANATORY NOTES

Introduction

This publication presents monthly estimates of the value of retail sales classified by *industry* (i.e. type of store) for Australia and each State.

2. Quarterly estimates of total retail sales at constant (average 1979-80) prices are also included.

3. All the series shown in this publication, with estimates for earlier periods, are available on AUSSTATS — see paragraph 30.

4. Quarterly estimates of retail sales classified by *commodity* groups are published in Catalogue No. 8503.0. Analysis of the quarterly commodity data may lead to revisions in the monthly industry series. For this reason the monthly figures which relate to periods subsequent to the latest quarterly release should be regarded as preliminary.

Scope and coverage

5. The estimates are derived from a survey which includes in its scope all retail trade establishments, i.e. establishments classified to subdivision 48 of the Australian Standard Industrial Classification (ASIC), 1983 Edition (Catalogue Nos. 1201.0 and 1202.0), *except* motor vehicle dealers, petrol retailers etc. (ASIC classes 4861-4868), bread and milk vendors (4878-4879), footwear repairers (4846) and electrical appliance repairers n.e.c. (4857). *Also included* are cafes and restaurants (9231), hotels, etc. (mainly drinking places) (9232), licensed clubs (9241-9243) and hairdressers (9351-9352).

6. The scope of the survey includes establishments in all States and the Australian Capital Territory, but excludes those in the Northern Territory.

7. The survey is based on a random sample of establishments within the scope defined above. From the data reported by the sampled establishments, aggregates comprising all retail sales in Australia (excluding Northern Territory) are estimated.

8. The retail sales reported are principally sales of new or used goods to final consumers for personal or household consumption. Excluded are sales of tools of trade, building materials and supplies, agricultural supplies and equipment, and business equipment. Sales of motor vehicles, parts, petrol, boats, caravans, etc. are out of scope of the estimates of retail sales in this publication. Also excluded are takings from meals consumed on the premises, accommodation, hairdressing, beauty treatments, and repairs. However, the estimates of retail sales in this publication include sales of take-away food, and beer, wine and spirits served with meals.

Industry statistics

9. Details of the value of retail sales are available for 15 industries. The ASIC class(es) which make up each industry are as follows:

Industry	ASIC Class(es)
Grocers, confectioners, tobacconists	4881
Butchers	4882
General stores	4815
Other food stores	4883, 4885, 4886
Hotels, liquor stores, licensed clubs	9232, 4884, 9241, 9242, 9243
Clothing and fabrics stores	4843, 4844, 4847
Department stores	4814
Footwear stores	4845
Domestic hardware stores, jewellers	4853, 4854
Electrical goods stores	4855, 4856
Furniture stores	4849
Floor coverings stores	4848
Chemists	4891
Newsagents	4894
Other	4892, 4893, 4895, 4896, 4897, 9231, 9351, 9352

Reliability of estimates

10. Since the estimates are based on information obtained from a sample survey of retail establishments, the estimates of levels and changes are subject to sampling variability; that is, they may differ from the figures that would have been produced if all units had been included in the survey. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.

11. Standard errors of estimates for the latest month and of estimates of change since the preceding month are shown in the tables. Examples of the use of these standard errors are given below:

(a) The estimate of \$4,696.2 million for the total value of retail sales in August 1987 has a standard error of about \$30.4 million. Therefore, there are two chances in three that the figure which would have been obtained if all establishments had been included in the survey would be within the range \$4,665.8 million to \$4,726.6 million, and nineteen chances in twenty that the figure would be within \$4,635.4 million to \$4,757.0 million.

(b) The estimated change of -\$247.6 million (-5.0 per cent) in the total value of retail sales between July 1987 and August 1987 has a standard error of about \$11.2 million (0.2 per cent). Therefore, there are two chances in three that the change which would have been obtained if all establishments had been included in the survey would be within the range -\$236.4 million to -\$258.8 million (-11.0 per cent to -11.4 per cent) and nineteen chances in twenty that the change would be within -\$225.2 million to -\$270.0 million (-10.8 per cent to -11.6 per cent).

12. Standard errors of estimates of change between non consecutive months are not shown in this publication. These standard errors are generally much higher than the standard errors of change between consecutive months. For example, the standard error of change between the latest month and the corresponding month of the previous year is, on average, approximately 1.4 times the standard error of *level* of the latest month.

13. Users of the statistics in this publication should note that the standard errors are relatively large for estimates for some industries in some States.

14. Seasonally adjusted, trend and constant price estimates are also subject to sampling variability. For seasonally adjusted estimates, the standard errors in percentage terms approximate those for the unadjusted series. For trend estimates, the standard errors are generally not larger than for the seasonally adjusted estimates and are likely to be smaller. For constant price estimates, the standard errors may be up to 10 per cent higher than those for the corresponding current price estimates, because of the sampling variability contained in the prices data used to deflate the current price estimates.

15. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting

by respondents and errors made in collection and processing of data. Inaccuracies of this kind are referred to as the non-sampling error and they may occur in any collection, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of forms, editing of data and efficient operating procedures.

Seasonally adjusted and trend estimates

16. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences can be more clearly recognised. In the seasonal adjustment of the retail sales estimates, account has been taken of both normal seasonal factors and 'trading-day' effects (arising from the varying numbers of Sundays, Mondays, Tuesdays etc. in the month). For total retail sales for Australia, adjustment has also been made for the effects of change in the date of Easter and Australia Day holidays. Seasonal adjustment does not remove from the series the effect of irregular influences (e.g. abnormal weather, industrial disputes) and the seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject. Details of the methods used in seasonally adjusting these series are available on request.

17. The smoothing of seasonally adjusted series to create trend estimates is a means of reducing the impact of the irregular component of the series. The trend estimates of retail sales have been derived by applying a 13-term Henderson weighted moving average to the seasonally adjusted series.

18. While this smoothing technique enables estimates of trend to be produced for the latest month, it does result in revisions to the estimates for the most recent months as data for subsequent months become available. Generally subsequent revisions become smaller and after 3 months have a negligible impact on the series. There will also be revisions as a result of revisions to the original estimates and periodic reviews of seasonal and trading day factors.

19. This publication includes monthly estimates of trend of retail sales for Australia, classified by industry, and for each State (total all industries). Seasonally adjusted estimates for industries and States are not included. These series, which commence in April 1982, are not long enough to provide sufficient information to allow reliable seasonal adjustment at present, since the seasonally adjusted estimates are subject to a relatively high degree of revision as data for later months become available and are taken into account in the re-estimation of seasonal and trading day factors. However the estimates of trend included in this publication are not expected to be subject to the same degree of revision.

20. The seasonal adjustment of each industry series and each State series has been done independently and so, for any one month, the estimates of trend for industries and States may not add to the estimates of trend of total retail sales for Australia.

21. Seasonally adjusted and trend estimates of retail sales by industries in each State are not included because the series are not yet long enough to allow reliable adjustment.

22. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series — Estimates of 'Trend'* (1316.0) and *Time Series Decomposition — An Overview* (1317.0) for more detailed information on smoothing of seasonally adjusted time series data.

Estimates at constant prices

23. A quarterly series of the value of total retail sales at average 1979-80 prices is provided in both original and seasonally adjusted form. The scope of the series at constant prices is identical to that of the series at current prices.

24. The series is a measure of change in value after the direct effects of price changes have been eliminated. Measures of this type are subject to approximations and assumptions, and should not be interpreted in any precise quantitative sense.

25. Further information on the nature and concepts of constant price estimates is contained in Chapter 4 of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

26. As indicated in paragraph 4, the estimates of retail sales (at current prices), for months subsequent to the latest quarterly release, may be revised following analysis of the quarterly commodity data. Similarly, the constant price estimates of total retail sales for quarters subsequent to the latest quarterly release may be revised and therefore should be regarded as preliminary.

Related publications

27. Estimates of retail sales at current and constant prices for States and commodity groups are published quarterly in *Retail Sales of Goods (Excluding Motor Vehicles, Parts, Petrol, etc.)*, Australia (8503.0).

28. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
