- resilience to DDoS attacks. I was just curious as to whether our architecture has proven resistance to attack.

At high level our architecture resists DDoS attacks via use of multiple layers of security. An attack would need to successfully breach the following layers to reach our web servers:

In general terms our experience is that most external DDoS attacks are stopped at the or, increasingly, in front of it as cloud services are more widely utilised. The 2016 Online Census uses for key web-facing elements such as content and email delivery.
