1 SURVEY OVERVIEW

1.1 ABOUT THE SURVEY

The Australian Bureau of Statistics (ABS) commissioned ENGINE to conduct the 2020 Community Trust in ABS Statistics Survey (CTASS). This is the third iteration of the survey, which was previously undertaken in 2010 and 2015. This report presents a summary of the key findings for the 2020 CTASS.

The purpose of the CTASS was to measure and identify any changes in the level of trust the general community and informed users of ABS data have in official statistics.

The General Community Survey involved Computer-Assisted Telephone Interviewing (CATI) and was a single frame random mobile design.

The Informed User Survey used a list provided by the ABS.

The main fieldwork period took place from March 2020 to May 2020. The average survey length for the General Community Survey was 17 minutes; and 15 minutes for the Informed Users Survey.

1.2 ABOUT THIS REPORT

The results for the General Community Survey have been weighted to the Australian population. Statistical tests have been carried out to highlight significant differences between key subgroups. Significant differences for these analysis variables are reported in the text. Where no differences are found this is not mentioned.

Weighting was not applied to the informed user dataset and statistical tests have not been carried out between the different types of user; due to the nature of the sample, which was not random probability based; and because of the small number of economists and journalists (who have been combined into one group for analysis purposes).

Comparisons with the 2015 CTASS are presented in Section 3.4 . Significance testing at a probability level of 0.05 has been carried out. An asterisk (*) in the charts indicates a statistically significant difference between the results. Since the informed users were sampled non-randomly, no significance testing has been done between the survey years.

Percentages have been rounded up to whole integers. Single-response items may not add to 100% due to rounding. Multiple-response items might add to more than 100% due to respondents selecting multiple response codes.

The bases presented in the tables and figures are unweighted numbers.

The project was carried out in compliance with ISO 20252 and membership requirements for Association of Market and Social Research Organisations (AMSRO) and the Research Society.

2 METHODOLOGY

The survey questionnaires were provided by the ABS. To allow for comparability with the previous 2015 CTASS, the questions asked were kept the same where possible.

It is worth noting that the 2020 CTASS was undertaken during the COVID-19 pandemic, which was saturating the media. Therefore, interpretation of the results should be considered in light of this unprecedented and evolving situation.

2.1 GENERAL COMMUNITY

The 2020 CTASS involved n=2,203 CATI with Australian residents, aged 15 and over, from all states and territories. However, of the n=2,203 interviews achieved, 24 interviews had missing data required for weighting and were therefore excluded from the sample. The remaining 2,179 records have been weighted to the Australian population by Age, Gender and Part-of-State and Education to provide estimates of the Australian population.

The General Community Survey used a single frame random mobile design and the sample was provided by SamplePages.

The response rates and cooperation rates were calculated based on the internationally recognised American Association for Population Opinion Research (AAPOR) standards. The cooperation rate for the General Community Survey was 11.4% and the response rate was 4.6%.

Table 1. General Community – Key field statistics

Key field statistics	
Target interviews	2,200
Interviews achieved	2,203
Average survey length	17 mins
AAPOR Cooperation Rate	11.4%
AAPOR Response Rate	4.6%
Total sample records used	57,499
Fieldwork period	25 March to 4 May 2020

2.2 INFORMED USERS

The sample was compiled and provided by the ABS and included academics (the vast majority), journalists and economists who are known users in direct contact with the ABS; and had agreed to be contacted for research purposes. The Informed Users Survey set out to achieve up to n=180 interviews from a list of n=223 users of ABS statistics. No quotas were set by user type. A total of n=178 interviews were achieved with 166 academics, 4 journalists and 8 economists.

The cooperation rate for the informed user survey was 81.7% and the response rate was 81.7%.

Table 2. Informed Users – Key field statistics

Key field statistics	
Target interviews	180
Interviews achieved	178
Average survey length	15 min
AAPOR Co-operation Rate	81.7%
AAPOR Response Rate	81.7%
Total sample records used	223
Fieldwork period	9 April to 28 April 2020

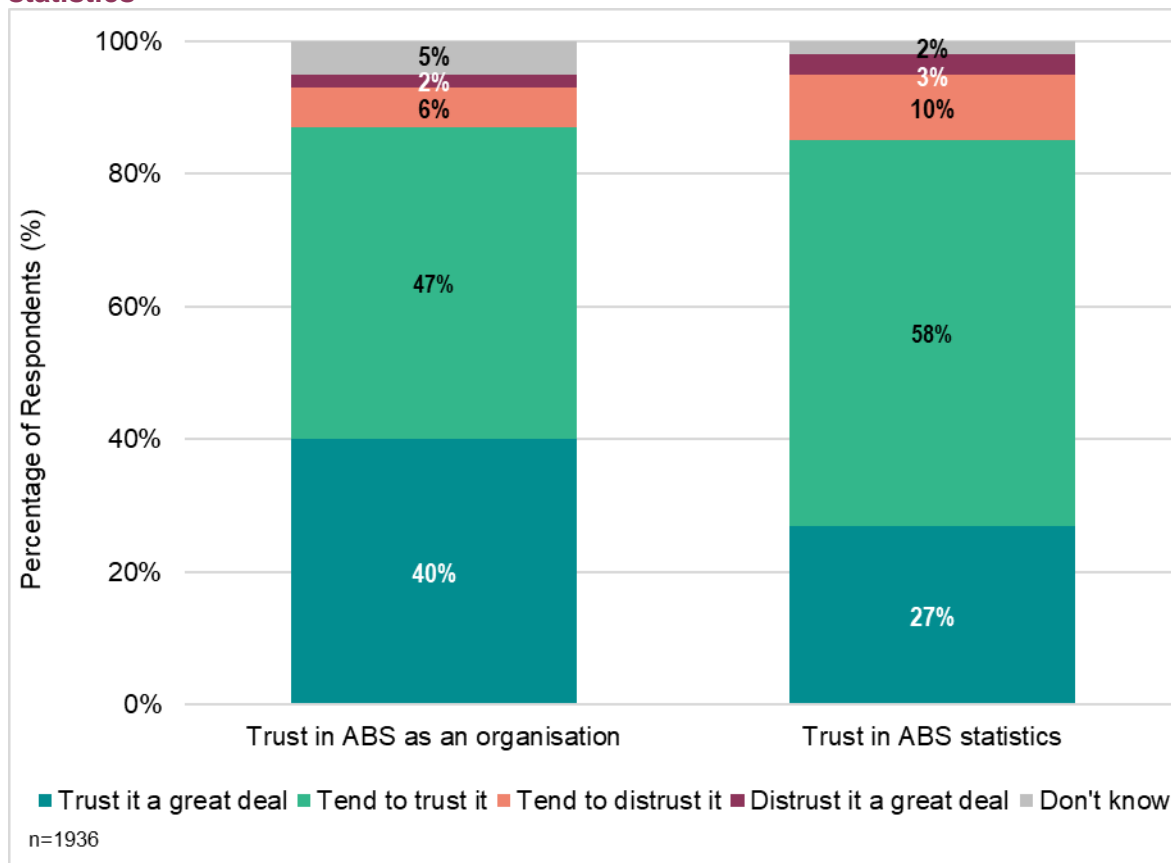

3 KEY FINDINGS

3.1 TRUST IN ABS

Overall trust in the ABS as an organisation and overall trust in ABS statistics were positive with more than four in five general community respondents stating this.

Overall, 87% of respondents indicated that they trusted the ABS as an organisation with 40% saying that they ‘trust it a great deal’ and 47% indicated that they ‘tend to trust it’. Similarly, 85% of respondents indicated that they trusted the statistics produced by the ABS with 27% saying that they ‘trust them a great deal’ and 58% indicating that they ‘tend to trust them’.

Figure 1. General Community - Trust in ABS as an organisation compared to trust in ABS statistics

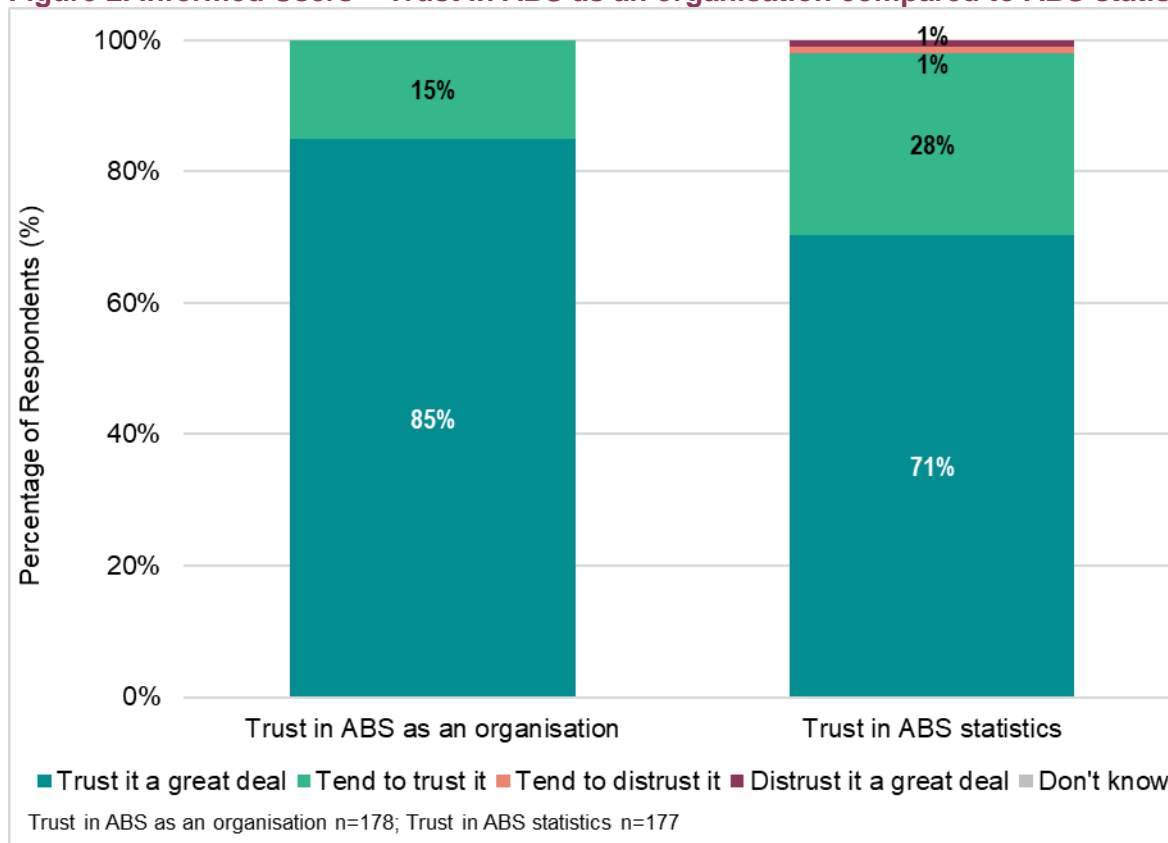

Base: Respondents who had heard of the ABS (n=1,936)

There were higher levels of trust among informed users, in the organisation itself as well as the statistics it produces. All users (100%) said that they trusted the ABS as an organisation with 85% saying ‘a great deal’ and 15% indicating that they ‘tend to trust it’. The degree of trust in ABS statistics was high (98%) with 71% saying they trust them ‘a great deal’ and 15% indicating that they ‘tend to trust them’, as shown in Figure 2.

Academics tended to report higher levels of trust than journalists/economists for both the organisation itself (86% versus 67%) and its statistics (72% versus 58%). However, the number of journalists/economists was small; and this should be taken into account. These results are shown in Figure 3.

Figure 2. Informed Users – Trust in ABS as an organisation compared to ABS statistics

Note: One person said they did not use ABS statistics.

Figure 3. Informed Users – Trust in ABS as an organisation compared to ABS statistics by user

Note: One person said they did not use ABS statistics. Small sample size for journalists/economists – these results should be treated with caution.

In keeping with the 2015 CTASS, socio-economic status (SES) was derived from occupation and education of the general community respondents.

Respondents with a high SES background were more likely to trust (a great deal or tend to trust) the ABS as an organisation than those with a low SES background (92% compared with 79%), as shown in Figure 4.

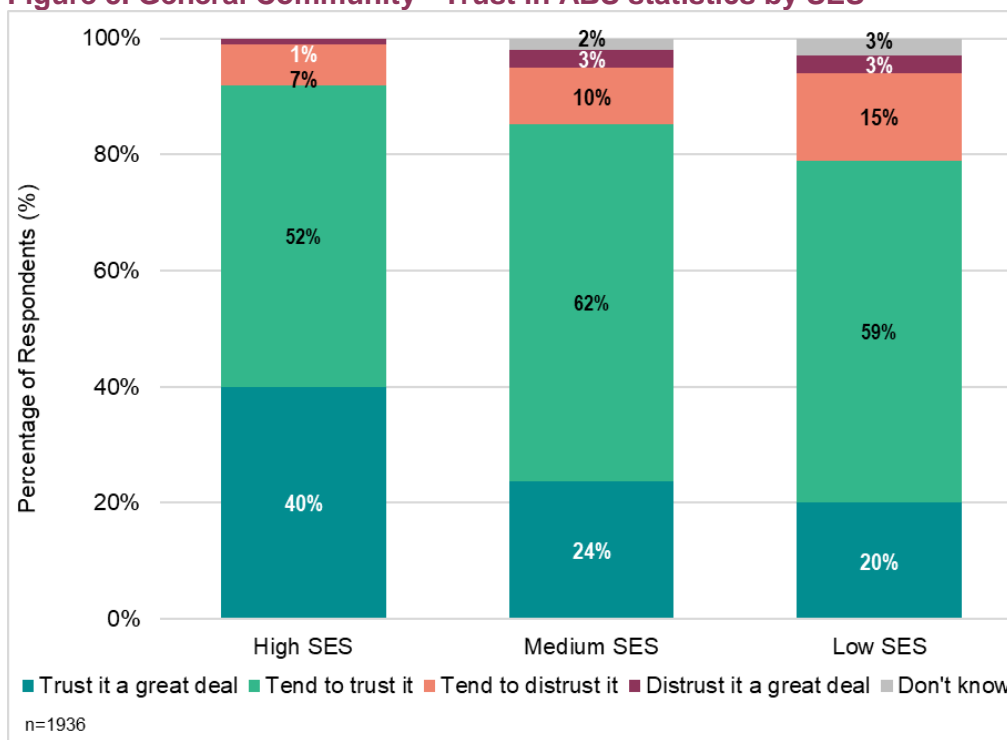

Similarly, people with a high SES were also more likely to trust (a great deal or tend to trust) the statistics produced by the ABS than those with a low SES background (92% compared with 80%), as shown in Figure 5.

Figure 4. General Community - Trust in ABS as an organisation by SES

Base: Respondents who had heard of the ABS (n=1,936)

Figure 5. General Community - Trust in ABS statistics by SES

Base: Respondents who had heard of the ABS (n=1,936)

There was a positive association between level of familiarity and level of trust. General community respondents who indicated that they know the ABS well were more likely to say that they trust it 'a great deal' (63%, compared with 33% of those who know the ABS only 'a little bit' or had only heard of the name (17%)).

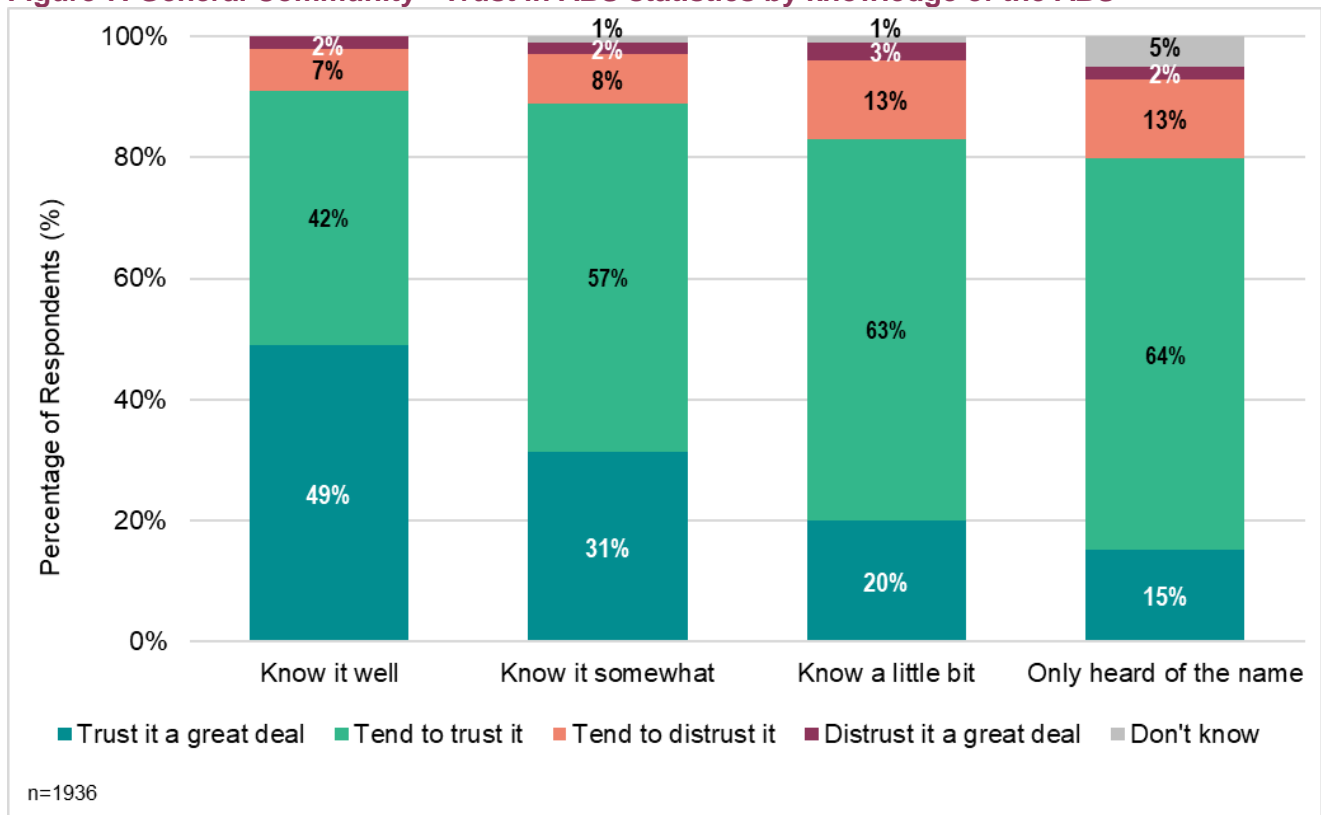

Figure 6. General Community - Trust in ABS as an organisation by knowledge of the ABS

Base: Respondents who had heard of the ABS (n=1,936)

Respondents with higher levels of familiarity with the ABS also had higher levels of trust in its statistics. Of those who knew the ABS well, 49% reported 'a great deal' of trust in ABS statistics. This compared with 20% of those who knew the ABS 'a little bit' and 15% who had 'only heard of the name'.

Figure 7. General Community - Trust in ABS statistics by knowledge of the ABS

Base: Respondents who had heard of the ABS (n=1,936)

3.2 FUTURE ABS STATISTICS

General community respondents who were familiar with at least one of the ABS sets of statistics (Census, employment and unemployment, GDP or CPI) and informed users were asked a set of questions about future statistics produced by the ABS. Positivity about future ABS statistics was higher among informed users than in the general population; with 76% of users in ‘strong agreement’ with the usefulness of future information, compared with 35% of the general community.

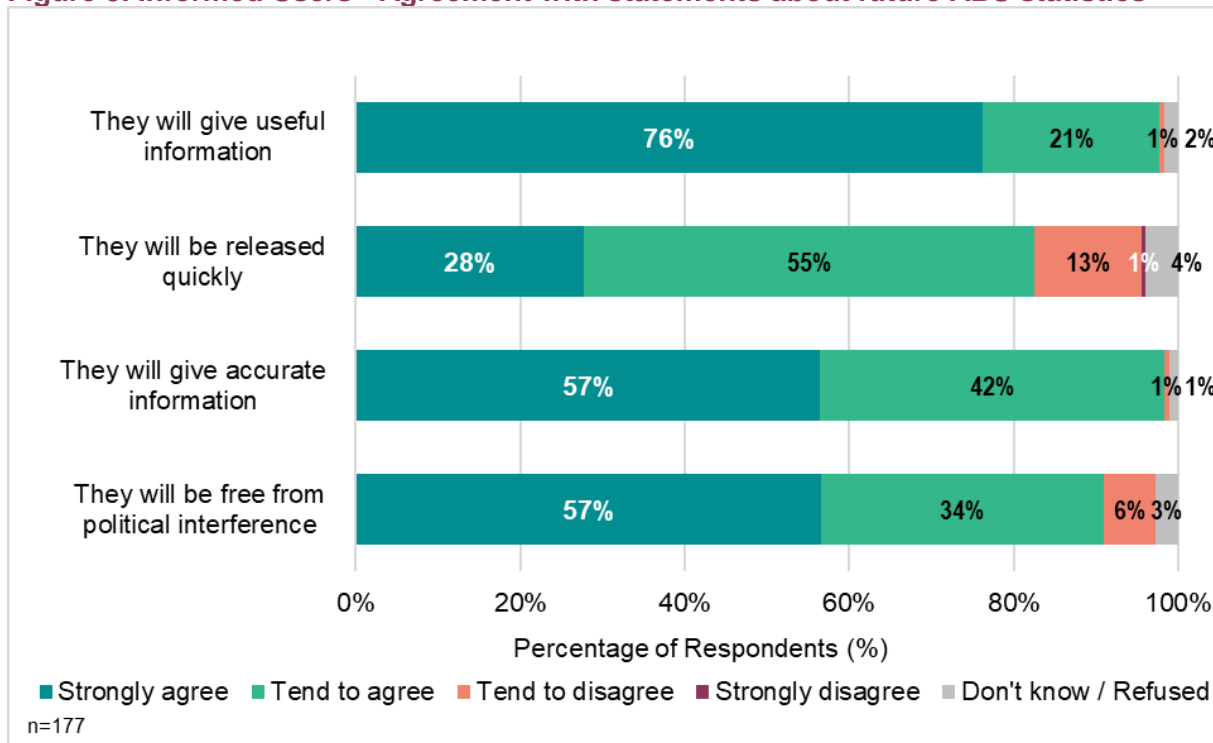

Overall, around four in five general community respondents (83%) believed that future information would be accurate, three quarters (75%) agreed that it will be released quickly; and a slightly lower proportion agreed that it will be free from political interference (65%). Equivalent figures for informed users were higher at 98%, 82% and 91% (respectively).

Figure 8. General Community - Agreement with statements about future ABS statistics

Base: Respondents who were familiar with ABS statistics (n=1,706)

Figure 9. Informed Users - Agreement with statements about future ABS statistics

Base: Respondents who had heard and used ABS statistics (n=177)

3.3 PROVIDING INFORMATION TO THE ABS

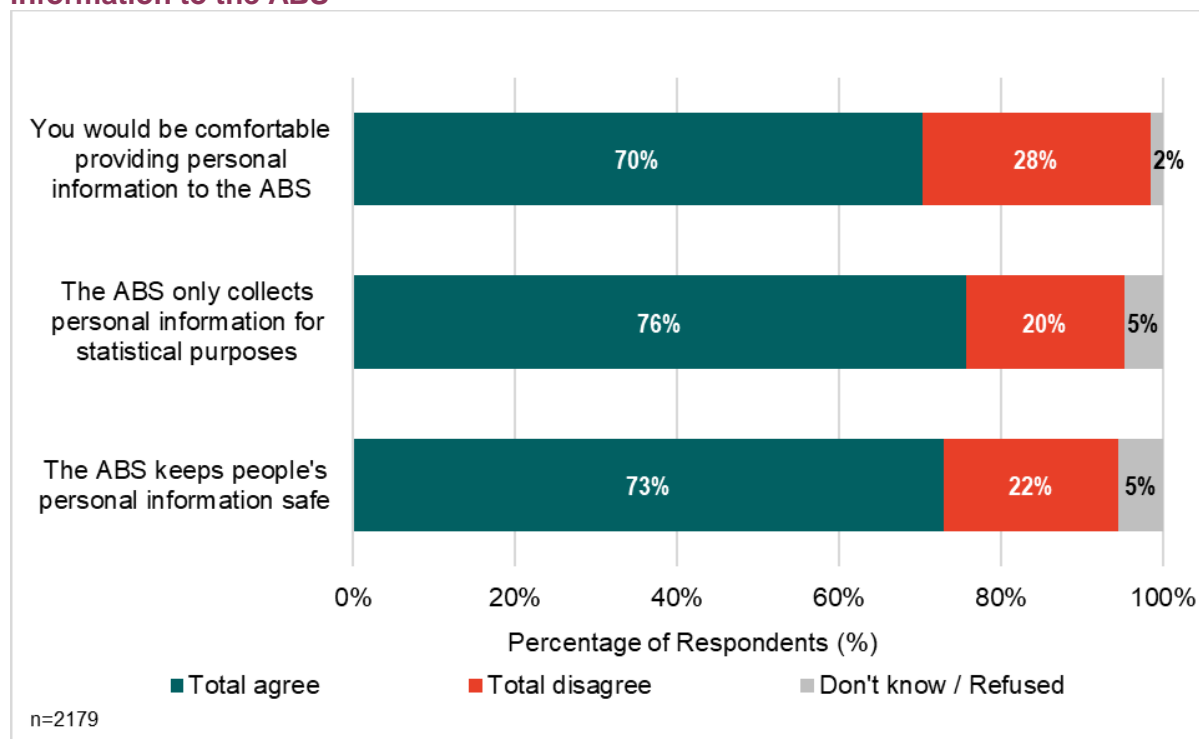

General community respondents were asked how they felt about providing information to the ABS in general. Positively, 76% of respondents agreed “the ABS only collects personal information for statistical purposes”, while 73% believed that the “ABS keeps people’s personal information safe” and 70% indicated that they “would be comfortable providing personal information to the ABS.” The full results are shown in Figure 10 and the overall results for level of agreement and disagreement is shown in Figure 11.

Figure 10. General Community – Providing information to the ABS

Base: All respondents (n=2,179)

Figure 11. General Community – Overall level of agreement and disagreement about providing information to the ABS

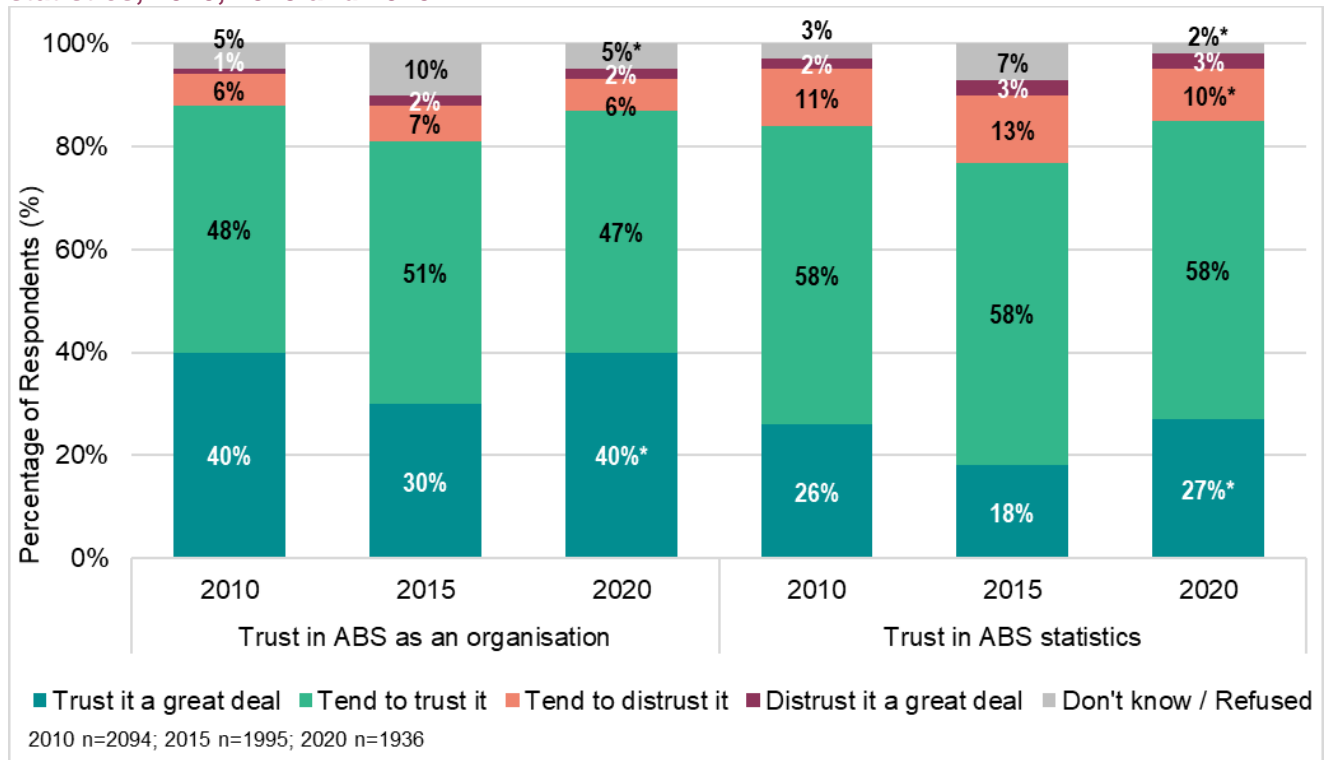

Base: All respondents (n=2,179)

3.4 COMPARISON WITH THE 2015 CTASS

There was a significant increase in the proportion of respondents in the general community who said they trust the ABS as an organisation ‘a great deal’, from 30% in 2015 to 40% in 2020. There was a significant decline in the proportion of respondents who said ‘don’t know or refused’ (5%, down from 10% in 2015).

In 2020, there was a significant increase in the proportion of respondents indicating that they trust ABS statistics ‘a great deal’ (27%, up from 18% in 2015). Conversely, there was a significant reduction in the proportion of respondents who said that they distrust the statistics produced by the ABS (13%, down from 16% in 2015).

Figure 12. General Community - Trust in ABS as an organisation compared to trust in ABS statistics, 2010, 2015 and 2020

Base: Respondents who had heard of the ABS. 2010 (n=2,094); 2015 (n=1,995); 2020 (n=1,936)

Asterisks (*) in chart denotes a statistically significant difference to the 2015 result

Trust among informed users has remained unchanged since 2015, with all users (in both survey years) indicating that they trust the ABS as an organisation (100%). Similarly, trust in ABS statistics in this sample has remained unchanged since 2015 (99%).

Figure 13. Informed Users - Trust in ABS as an organisation compared to trust in ABS statistics, 2010, 2015 and 2020

Respondents were asked to think about future ABS statistics. As shown in Figure 14, there was a significant increase in the proportion of general community respondents strongly agreeing that future ABS statistics will give useful information (35%, up from 26% in 2015); give accurate information (26%, up from 17% in 2015) and be free from political interference (18%, up from 14% in 2015).

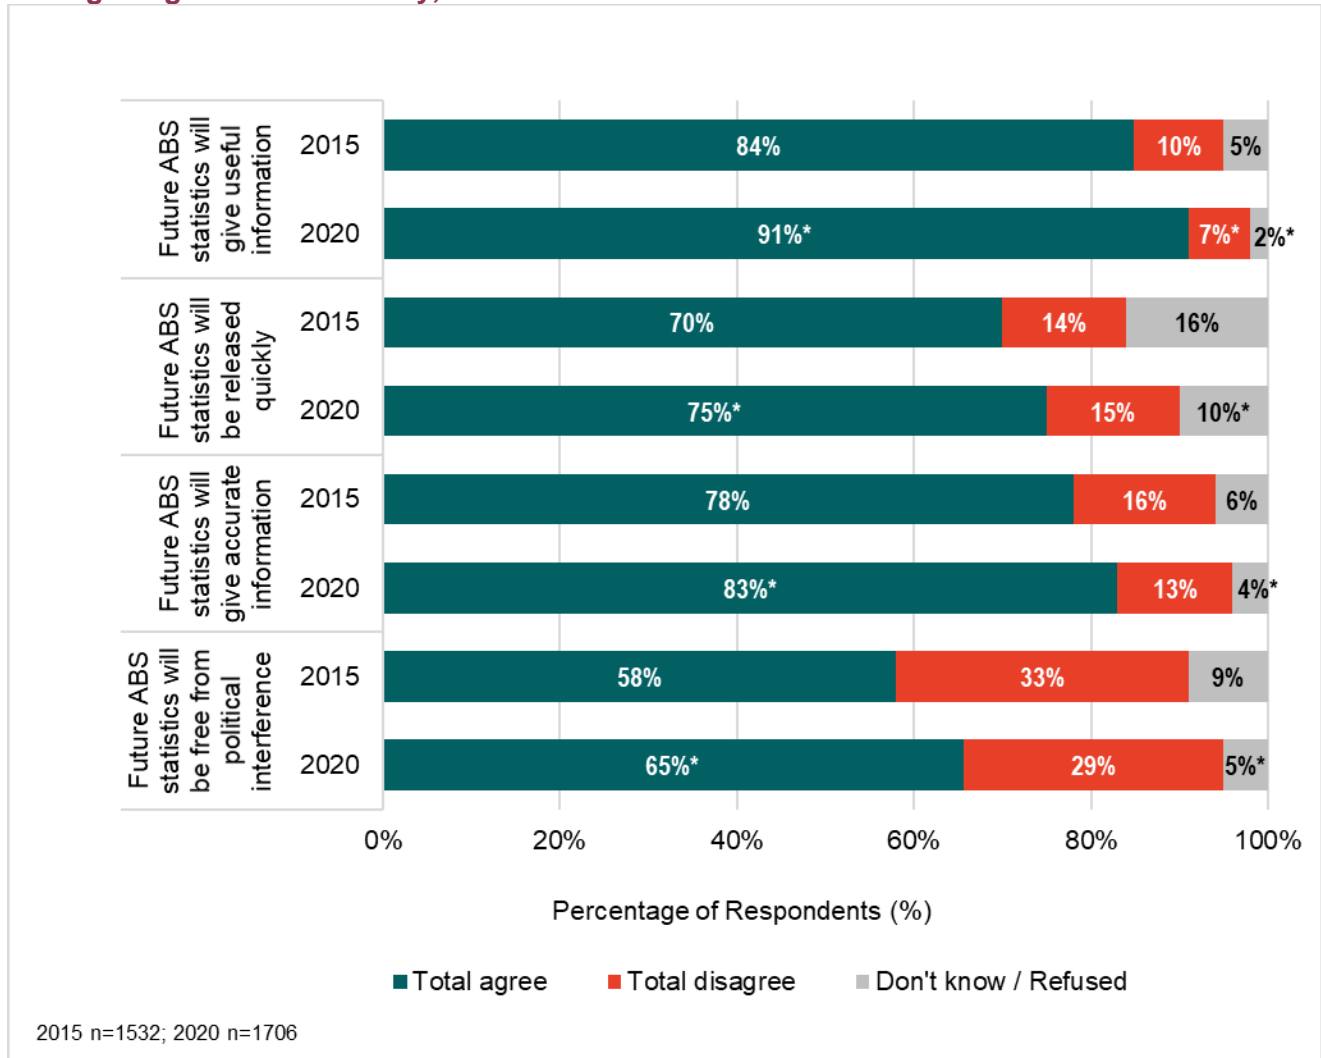

The full results are shown in Figure 14 and the overall agreement and disagreement is shown in Figure 15.

Figure 14. Agreement with statements about future ABS statistics among the general community, 2015 and 2020

Base: Respondents who were familiar with ABS statistics. 2015 (n=1,532); 2020 (n=1,706)
 Asterisks (*) in chart denotes a statistically significant difference to the 2015 result

Figure 15. Overall agreement and disagreement with statements about future ABS statistics among the general community, 2015 and 2020

Base: Respondents who were familiar with ABS statistics. 2015 (n=1,532); 2020 (n=1,706)
 Asterisks (*) in chart denotes a statistically significant difference to the 2015 result

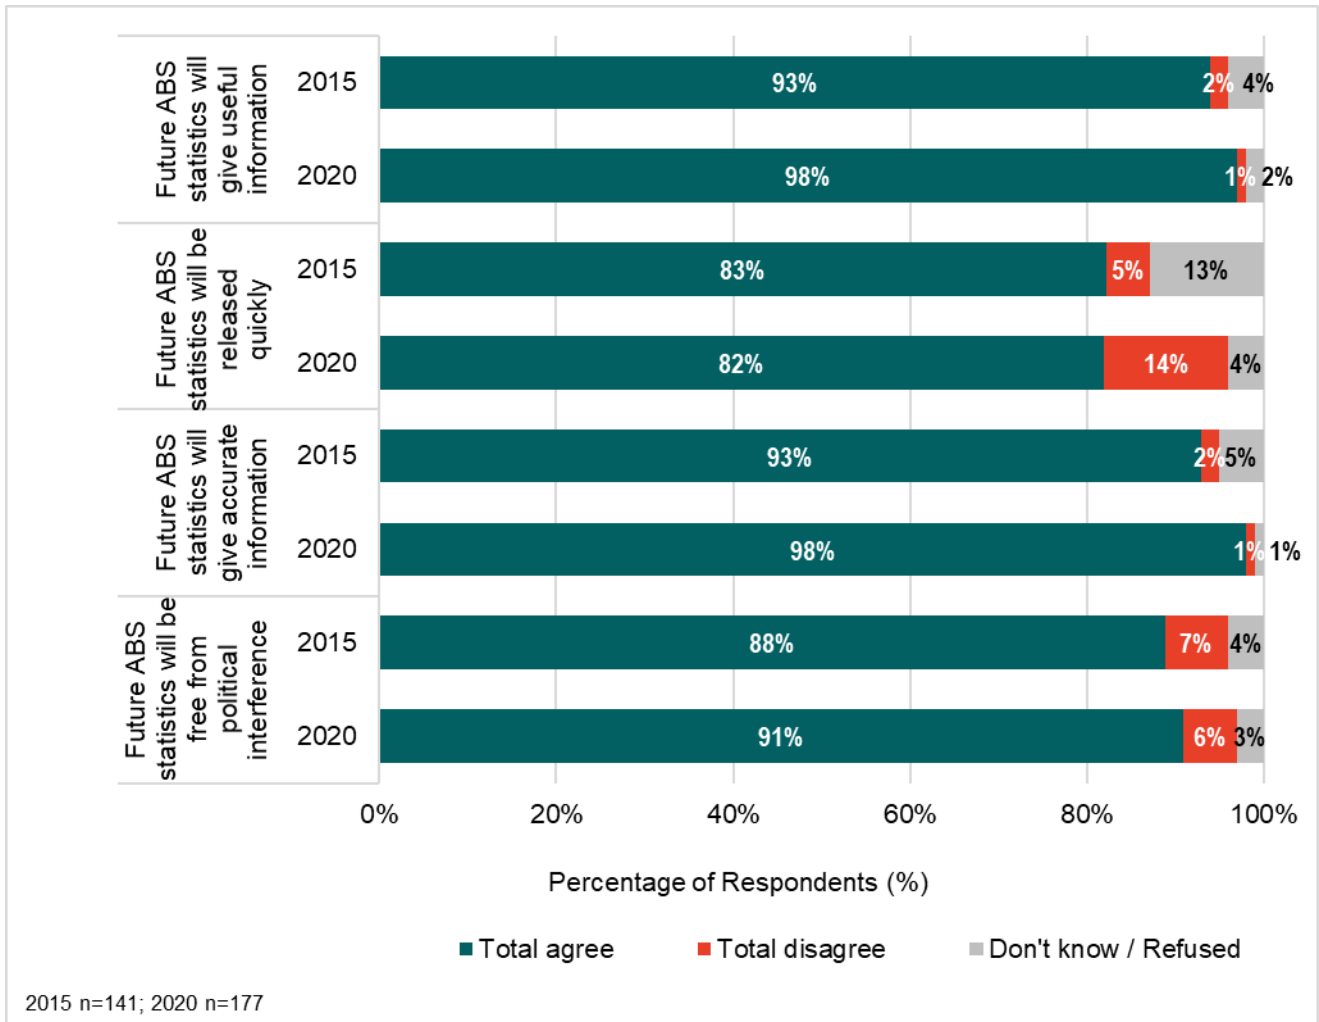

Informed users were also asked to think about future ABS statistics. There was a slight increase in the proportion of users agreeing that future ABS statistics will give useful information (98%, up from 93% in 2015); give accurate information (98%, up from 93% in 2015) and freedom from political interference (91%, up from 88% in 2015). The full results are shown in Figure 16 and the overall agreement and disagreement is shown in Figure 17.
